

Fig. C5. Yafit (3) – the section in Area D, looking east.

from the north-west. Most of the pottery found was Late Roman. In addition, the architectural similarity of these walls to the other Stratum 1 walls on the site suggests that they all belong to the Late Roman period occupation.

The Pottery Assemblage

The following discussion presents the pottery of the Iron Age I-II Stratum 2 assemblage. The Late Roman (Stratum 1) pottery will be presented in later publications.

Similarly to the enclosure of Bedhat esh-Sha'ab, there is a sharp contrast here between the size and strength of the Stratum 2 architecture and the relatively small amount of pottery finds. This limits the validity of the possible assumptions drawn from the ceramic analysis.

The overall number of Iron Age sherds found in the excavation was 114 (almost half of the total amount of sherds collected). Only 2● sherds were

indicative (Table C1), mainly rims. The meagre amount of finds of all periods, but especially of the Iron Age, is typical of the Jordan Valley sites (Ben-Yosef 2007: 116-161), and therefore this discussion will also include indicative finds from the survey of the site prior to the dig.

Parallels to the described finds were found mainly in the nearby Iron Age enclosure of Bedhat esh-Sha'ab. Other parallels were in sites in the eastern Jordan Valley, Samaria Mountains, Jezreel Valley and the Coastal Plain.

Type	CP	Kraters	Jugs	Painted	Total
Number	9	1	6	4	20
%	45	5	30	20	100

Table C1. Yafit (3) - Types of indicative pottery.

Cooking pots (henceforth CP)

Three sherds of CP Type B and five of CP Type D were found in the dig (one CP Type A was also found in the survey prior to the dig).

CP Type A (Ben-Yosef 2007: fig. 227:11) has a short rim and a squashed body, dark clay with many inclusions and good firing. This type is very common in the early Iron Age (early 12th century BCE), and parallels were found at Bedhat esh-Sha'ab (Ben-Yosef 2007: fig. 224:20), Megiddo VIII (Loud 1948: pl. 61:27), Ta'anach, period IA (Rast 1978: fig. 2:2-6), Shilo VI (Bunimovitz and Finkelstein 1993: fig. 6.35:8-14), and Mt. Ebal II (Zertal 1986-1987: fig. 11:4, 6).

The CP Type B has a trefoil rim. The dark-brown clay includes shiny inclusions (Fig. C6:1-2). This type is very common during the 12th-11th centuries BCE (Zertal 1986-1987: 130; 1991: 39-40), and parallels were found at Bedhat esh-Sha'ab (Ben-Yosef 2007: fig. 50:7, 9, 11), Tel Deir 'Alla (van der Kooij 2006: 219, fig. 1:C16), where it was dated to the beginning of the Iron Age, Mt. Ebal IB (Zertal 1986-1987: fig. 17:6-8), Megiddo VI (Loud 1948: pls. 15-16), Tell Qiri VIII (Hunt 1987: fig. 16:4-6), Tell el-Hammah (Cahill 2006: fig. 4:4-7), the 'Bull Site' (Mazar 1982: fig. 9:12), and Shechem XII-XI (Finkelstein 2006: fig. 1:6)².

The CP Type D has a thick rounded rim with a small ridge at its lower part. The dark-brown clay includes shiny inclusions and the firing is good (Fig. C6:3-7). This type appears during the 10th-8th centuries BCE, and parallels were found at Bedhat esh-Sha'ab (Ben-Yosef 2007: fig. 50:10), Megiddo I-IV (Lamon and Shipton 1939: pl. 39:8, 11-21), Ta'anach, Period IIA-B (Rast 1978: fig. 76:8),

2 According to Finkelstein, who re-examined the pottery from Tel Balatah (Shechem), the Iron Age I ceramic tradition of the Central Hill Country Continues to early Iron Age II. As a result he claims that the ceramics from sites in this region, such as Kh. Radana and et-Tel (Ai), that were traditionally dated to the 12th and beginning of the 11th centuries BCE, should be also dated to the 10th century BCE. See Finkelstein 2002 for this 'low chronology'.

Tell el-Far'ah ([North], Chambon 1984: pl. 53:5-10), Samaria, Period VI (Kenyon 1957: fig. 9:18), Tell el-Hammah (Cahill 2006: fig. 4:8), and Dor 6b (Gilboa 2001: pl. 5-56:10).

Jugs

Seven jugs were found in the excavation, of four sub-types:

- A jug with a trefoil rim of light-brown clay with many inclusions and two handles located under the rim (Ben-Yosef 2007: fig. 227:13). Parallels were found at Tell Abu al-Kharaz (Fischer 2008: fig. 183:3), dated to the end of the Late Bronze Age, and the 'Bull Site' (Mazar 1982: fig. 9:14), dated to the 12th century BCE.
- A jug with a trefoil rim of dark-brown clay and good firing (Fig. C6:8), dated to the 12th-11th centuries BCE. Parallels were found at Bedhat esh-Sha'ab (Ben-Yosef 2007: fig. 51:7), Shilo V (Bunimovitz and Finkelstein 1993: fig. 6.59:6), el-Ahwat (Zertal and Mirkam 2000: fig. 69:1), Tell Qiri (Hunt 1987: fig. 40:9), Mt. Ebal IB (Zertal 1986-1987: fig. 19:12), and Ta'anach, Period I (Rast 1978: fig. 6:7).
- A jug with an everted rim, brown clay with many inclusions and good firing (Fig. C6:10-12), dated to the 11th-10th centuries BCE. Parallels were found at Bedhat esh-Sha'ab (Ben-Yosef 2007: fig. 51:6), Shilo V (Bunimovitz and Finkelstein 1993: fig. 6.47:10), Dor (Gilboa 2001: pl. 5.33:18), Ta'anach, Period IA (Rast 1978: figs. 6:16; 10:12-14), Beth-Shean 2 (Yadin and Geva 1986: fig. 9:8), and Tell el-Hammah (Cahill 2006: fig. 4:2).
- A jug with an everted rim, light-grey clay with many inclusions and good firing (Fig. C6:9), dated to the 10th-8th centuries BCE. Parallels were found at Bedhat esh-Sha'ab (Ben-Yosef 2007: fig. 51:8) and Tell Dan (Arie 2008: fig. 11:1, 3).

Kraters

Three krater rims were found in the survey prior to the excavations (Zertal 2005: fig. 231:1-3). The krater in Fig. C7:1 has a thick squashed rim, and its dark-brown clay has many inclusions, some shiny (see also Ben-Yosef 2007: fig. 227:8, 10). This type dates to the 11th-10th centuries BCE, with parallels found at Bedhat esh-Sha'ab (Ben-Yosef 2007: fig. 50:6), Ta'anach, Period IB (Rast 1978: figs. 21:7; 16:4), and Megiddo VI (Loud 1948: pl. 84:22).

Painted pottery

Four painted body sherds (Fig. C7: 2-5), probably of jugs, were found in deep deposits related to the enclosure wall. Three sherds are in the Canaanite tradition of black and red painting (Fig. C7:2-4). Two (Fig. C7:2-3) were found in the foundations of W24003, and according to them it can be claimed that the site

was founded in the early Iron Age. However, one can also find similar painted vessels in the 11th century BCE.

Parallels of similar painted ceramics were found at large Jordanian sites, such as Tell es-Saidiyeh (van der Steen 2004: fig. 6-15:3-4), Tel Deir Alla (van der Steen 2004: figs. 5-7:3; 7-10:1-2, 4, 11; 7-11:3, 5, 7, 10; 7-12:1, 12-14), and Tel Abu al-Kharaz (Fischer 2008: fig. 187:1, 3-4). They were dated to the end of the Late Bronze and the early Iron Age I. Additional parallels, dated to the Late Bronze, were found at Tel Jezreel (Zimhoni 1997: fig. 2.2:1-3).

One sherd, with a red-painted grid pattern (Fig. C7:5), has a parallel at Tell el-Ekhsas in Jordan, where it was dated to the end of the Late Bronze and the early Iron Age (van der Steen 2004: fig. 9-19:44).

Summary of the pottery assemblage

The dating of the limited repertoire of Iron Age pottery is mainly based upon the CP types. Mazar (1981: 1-36) and Zertal (1991: 28-50) have suggested classifying the Iron Age CP into four main Types: A (13th-12th century BCE), B (12th-11th century BCE), C (11th-10th century BCE), and D (10th-8th century BCE). In Yafit (3) nine CP rims were found: one of Type A, three of Type B, and five of Type D. Based on these, a range between the 12th to the 8th century BCE is proposed for the dating of the enclosure. The painted sherds, found in deep deposits adjacent to the enclosure wall, support a 12th century date for the construction of the wall.

The assemblage of Yafit (3) has some unique aspects:

1. The CP is the dominant vessel in the assemblage, comprising almost half of the indicative finds. It is possible that this vessel was used for water storage, as well as its common everyday use in cookery. It is also suggested that this vessel was used in the dairy, which was the commonest daily activity performed at the site according to the faunal remains (see below).
2. The assemblage totally lacks pithoi, jars, juglets and bowls. This implies that typical common activities, such as storage or the use of tableware, were not regularly performed at the site, suggesting a different type of activity.
3. Most of the indicative pottery was found near the enclosure wall, and not in the apparently vacant open space inside it, suggesting that most of the activity concerning pottery usage at the site took place near the enclosure wall.

A comparison between the Yafit (3) assemblage and that of the adjacent enclosure of Bedhat esh-Sha'ab shows some interesting results (Table C2). The CP is very common in both assemblages, being about half of the total indicative

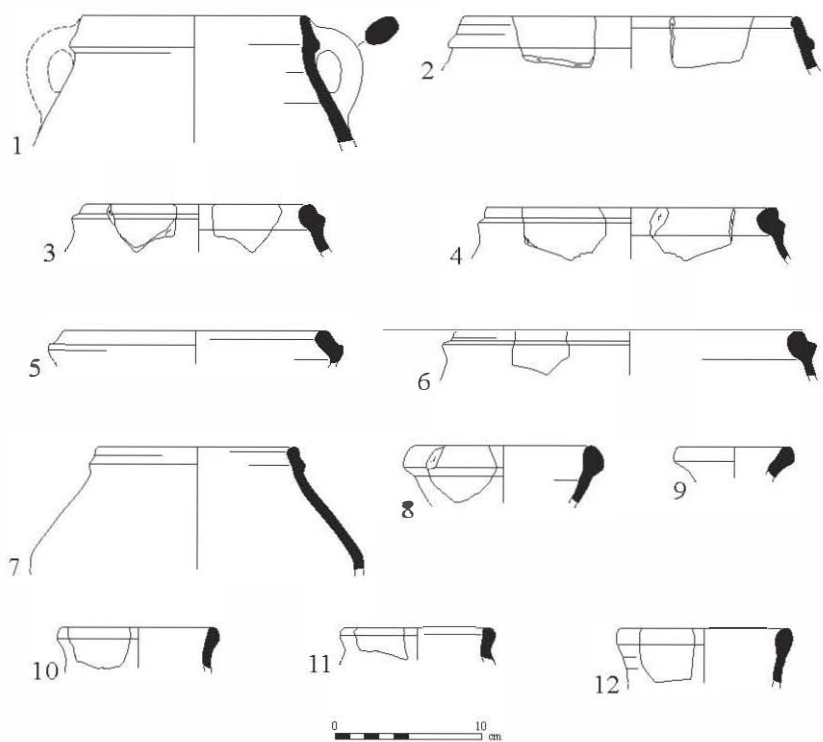

Fig. C6. Yafit (3) – The Iron Age pottery assemblage - part 1.

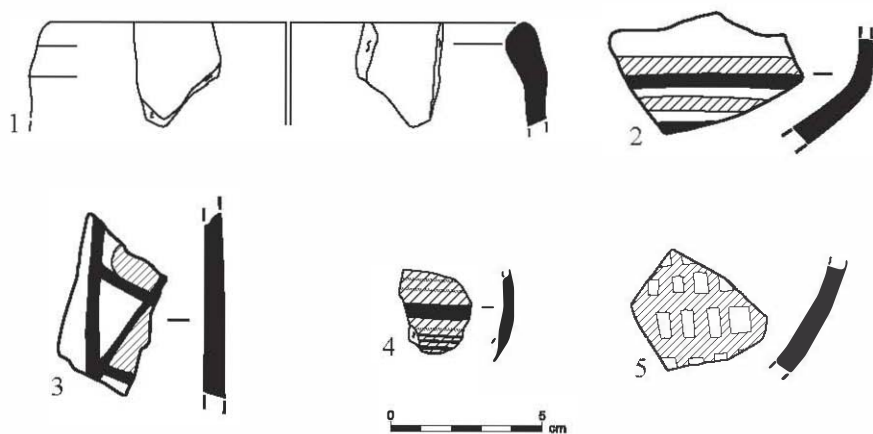

Fig. C7. Yafit (3) – The Iron Age pottery assemblage - part 2.

finds. The sites also share similar frequencies of kraters and jugs, and almost no bowls. The major difference between the sites is the presence of jars in the Bedhat esh-Sha'ab assemblage.

	CP	Kraters	Jugs	Jars	Bowls	Varia
Yafit (3)	45%	5%	30%	0%	0%	20%
Bedhat esh-Sha'ab	53%	5%	22%	13%	3%	4%

Table C2. Comparison of pottery types of Yafit (3) and Bedhat esh-Sha'ab.

The faunal remains³

All the animal bones from secure Iron Age II contexts were examined. Zooarchaeological and taphonomic analysis are described in Raban-Gerstel et al. 2008. A total of 13 identified bones were found (Table C3), all belonging to goat/sheep – *Capra hircus/Ovis aries* (only one distal metacarpal was specifically assigned to *Ovis aries*). The sparse faunal assemblage did not allow the reconstruction of mortality profile, age or sex structure.

Area	Locus	Bone	Part of bone	Side	Type
A	21001	Radius	Shaft	?	<i>Capra/Ovis</i>
A	21001	Molars (1+2) and pre-molars (3+4)	Mandible	Left	<i>Capra /Ovis</i>
A	21010	Humerus	Shaft and distal end	Right	<i>Capra/Ovis</i>
B	11002	Mandible	?	?	<i>Capra /Ovis</i>
B	11002	Tarsal/carpal	Shaft	?	<i>Capra/Ovis</i>
B	11002	Tarsal	Proximal end	?	<i>Capra/Ovis</i>
B	11002	Scapula	Shaft	?	<i>Capra/Ovis</i>
B	11002	Molar (1)	Mandible	Right	<i>Capra/Ovis</i>
B	11002	Pre-molar (4)	Mandible	Right	<i>Capra/Ovis</i>
B	12007	Carpal	Shaft	?	<i>Capra/Ovis</i>
B	12007	Ulna	Shaft	?	<i>Capra/Ovis</i>
B	11050	Carpal	Distal end	Right	<i>Ovis aries</i>
D	24005	Tarsal/carpal	Distal end	?	<i>Capra/Ovis</i>

Table C3. Yafit (3) faunal remains.

³ The faunal remains from the site were researched by Noa Raban-Gerstel of the University of Haifa. This is a short summary of the work.

Summary and conclusions

Yafit (3) is a two-stratum foot-shaped Iron Age I enclosure. It is situated in a low area overlooked by the ridge to the west, and no water source is available in its vicinity.

The site was occupied in two non-successive periods.

Stratum I is dated to the Late Roman period. Little construction activity within the enclosure was noted. The masonry is of long and thin irregular walls up to two courses high and without deep foundations. These were probably built by nomads or semi-nomads who used the site as a livestock pen. 52% of the shards collected belong to this period, probably stemming from a long duration of activity at the site.

Stratum II is dated to the Iron Age I-II, when the site was first settled (already during the early phases of Iron Age I) and the enclosure wall built. Only scanty remains of construction were noted inside the enclosure: walls and a room in Areas A and D, and installations in Area B. It is difficult to suggest what type of activities were carried out at the site because of the long period of use (according to the pottery, from the 12th to the 8th centuries BCE), and the scanty material culture remains.

Yafit (3) was a planned site, and thus differed from dozens of circular enclosures found in the Jordan Valley. I suggest that this site functioned as a cultic public place in an area inhabited by nomadic and semi-nomadic tribes. This assumption is supported by the discovery of the built path inside the enclosure wall, and the fact that the plan of the site was not changed during the 400 years of its existence. Another important aspect is the similarity to the adjacent foot-shaped enclosure of Bedhat esh-Sha'ab. It is suggested that Yafit (3) and Bedhat esh-Sha'ab are 'Gilgal' sites that are mentioned in the Bible as different kinds of camps in the Jordan Valley. In these camps the people of Israel assembled for cultic activities in times of war and peace (Gvanyahu 1954: 487-490; Zertal 2000: 248-251; 2005: 336, 527; Zertal and Ben-Yosef 2009). The Biblical phrase "And thou shalt go down before me to Gilgal; and, behold, I will come down unto thee, to offer burnt-offerings" (1 Sam, 10, 8) also suggests that the site was lower than its surroundings, as is the case of Yafit (3).

APPENDIX D

EXCAVATIONS AT ELEVATION POINT
-167 (SITE 192): 2007 SEASON

Shay Bar

Introduction

In the years 1995-2000 the area of Wadi Ahmar was surveyed by the Menashe Hill Country Survey. Nineteen new sites were discovered in this previously unexplored region: the site Elevation Point -167 (henceforth EP -167) stood out as one of the most intriguing.

EP -167 is a large site on a slope on the border of the wide valley of Wadi Ahmar, 3 km north of the modern village of Fasael (Fig. D1). The unpaved road from the Jordan Valley Monument to the Sartaba Fort passes through the outskirts of the site. The estimated size of the site is 12 dunams (1.2 ha), and the nearest water sources are 'Ein Suchon (Site 175, 2.5 km to the west) and 'Einot Fasael (3 km to the south). It is probable that in ancient times, before the water from its springs 4 km to the north-west was diverted for modern agricultural use, Wadi Ahmar flowed all year around. For a detailed description of the site and its environmental data see Site 192 in this volume.

Zertal noted that without excavation it is very difficult to date this site, and at first suggested that it might be dated to the Chalcolithic period. Only after the excavation commenced in the spring of 2007¹ were we able to date the site to the early phases of the Intermediate Bronze Age (henceforth IBA, also commonly termed Early Bronze Age IVa or Middle Bronze Age I). The site was excavated in order to understand the nature of the Wadi Ahmar sites that revealed advanced architectural traditions alongside material finds whose small number did not allow accurate dating.

¹ The excavations at the site were directed by the author with the support of S. Haad (graphic design), the Zinman Institute of Archaeology, the University of Haifa (academic support) and the Jordan Valley Regional Council (logistic support). All photographs presented here were taken by the author.

Methodology

The 2007 season lasted only six working days. The excavators were eight archaeological students and experienced volunteers who worked every day for 9 hours, and then returned to base in Fasael, where they washed and sorted the finds.

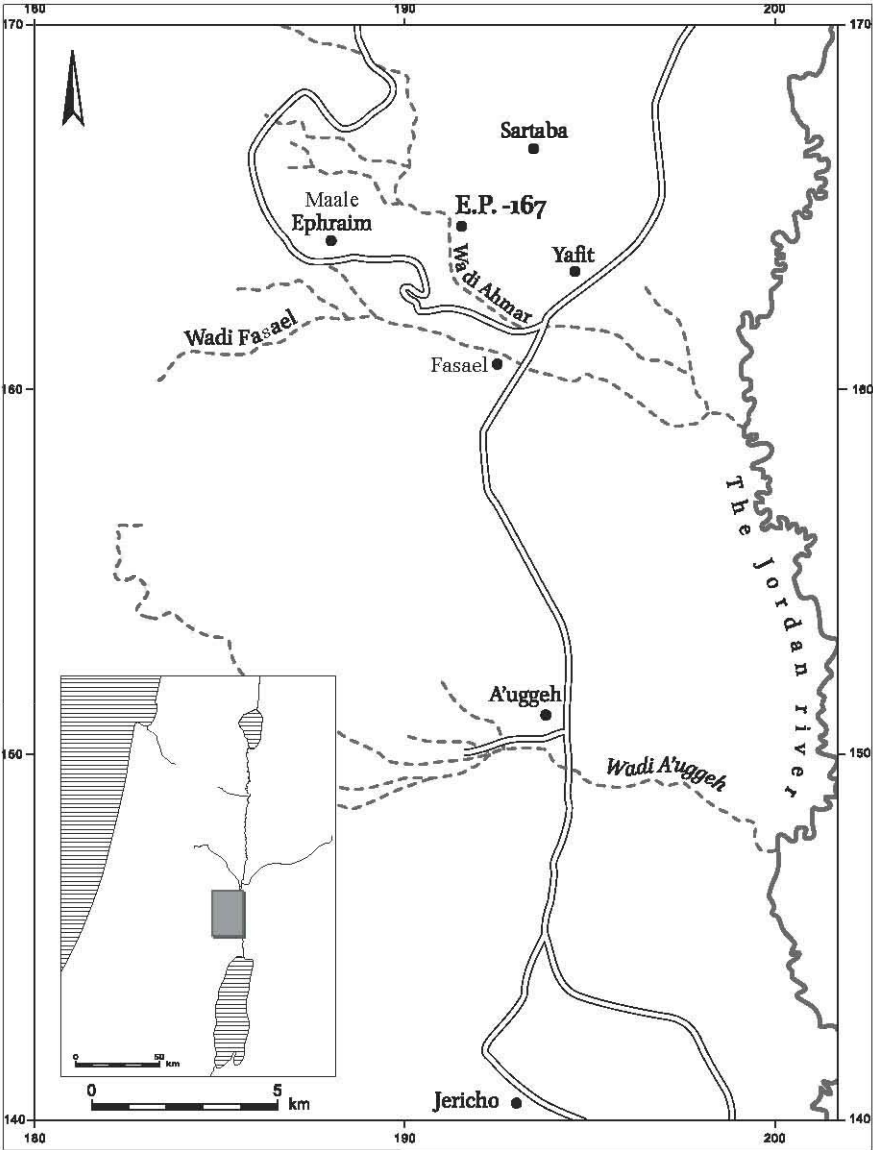

Fig. D1. General location map.

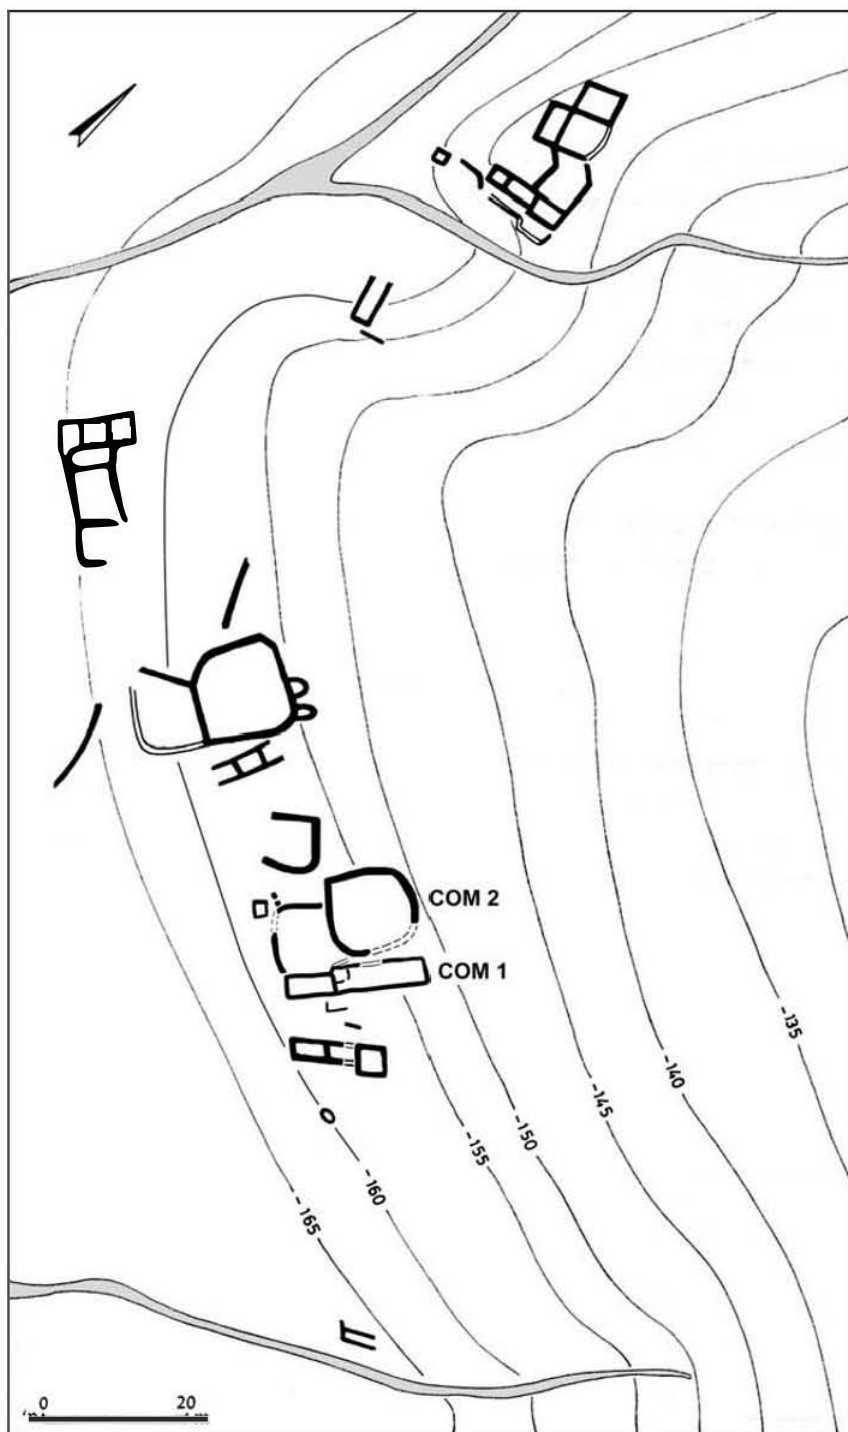

Fig. D2. The locations of Com1 and Com 2 on the survey plan of the site.

The author was in charge of all the field work and registration activities. The excavated area was first divided into loci based on the visual remains of walls on the surface of the site. In every unit at least one 50 cm-wide baulk was used for stratigraphic control. With the exception of topsoil and disturbed areas, the excavations for the most part were carried out using relatively fine tools (hand picks and small trowels). Ten percent of the excavated accumulations from fills and 80% of the recognized living surface deposits were dry-sifted through a 5 mm mesh. The development of the excavation was recorded daily. Further documentation included photography and dimensioned drawings of architectural plans. The material culture remains (ceramics, lithics, groundstone artifacts, etc.) were labelled, washed, and sorted. All finds were kept, except for non-diagnostic sherds, which were reburied at the site. It is important to note that, despite the sieving and careful sorting of finds during the dig, no animal bones were found.

Stratigraphy and Architecture

Two architectural units with a total excavated area of 60 sq. m, designated Com 1 and Com 2, were probed (Figs. D2 and D3): Com 1 is a 20 m-long building, with an average width of 4 m, divided into two Units (1 and 2). Unit 3, another room, 5×2 m in size, adjoining Com 1, was also excavated. Com 2 is an adjacent rectangular courtyard to the north-west of Com 1, where a test excavation was also carried out. In all areas excavated a single stratum from the IBA was found.

Com 1

Unit 1 – the south-eastern room (Figs. D3, D5-7):

It is 7.5×3.25 m in size, bounded by walls W4-6 and W8. The masonry is of very large boulders (e.g. two boulders in W5 are 1.5 m wide and 0.8 high, with an estimated weight of over half a ton). The preservation is mostly only one stone high, but W4 is better preserved, with two courses (Fig. D6). The fill inside the room and the area outside are full of collapsed stones that suggest that the foundation and at least the lower part of the room were built of stone. No signs of mud brick remains were found, and we did not find any evidence of the upper section of the walls, which were probably built of material that did not survive.

A living surface (L23) made of tamped soil with small patches of crushed lime was found in the eastern part of the room. On it baking installation L29 was found in the corner between walls W4 and W8. The installation is square 50×50 cm. It is built of flat stone slabs all bearing signs of fire. When the stones

were removed a rectangular shallow 20 cm-deep ash pit was found directly below the location of the flat slabs. The ash found in the pit was charcoal dust, probably the remains of wooden materials used to heat the stone slabs upon which the food was baked or heated.

In the western part of the room the living surface was not clearly visible. The very large lower grinding stone found *in situ* (Fig. D5) suggests the level of the living surface. It is interesting that the elevation of the living surfaces revealed in Unit 1 point to a 40 cm height difference between two floors in the same room. This can be explained either by the fact that the building is built on a slope, or by the poor preservation of the western part of the room, the lowest of the building, that also resulted in the sinking of the heavy grinding tool into the possibly poorly preserved living surface. Another less probable explanation is that here we have evidence of the remains of two different poorly preserved

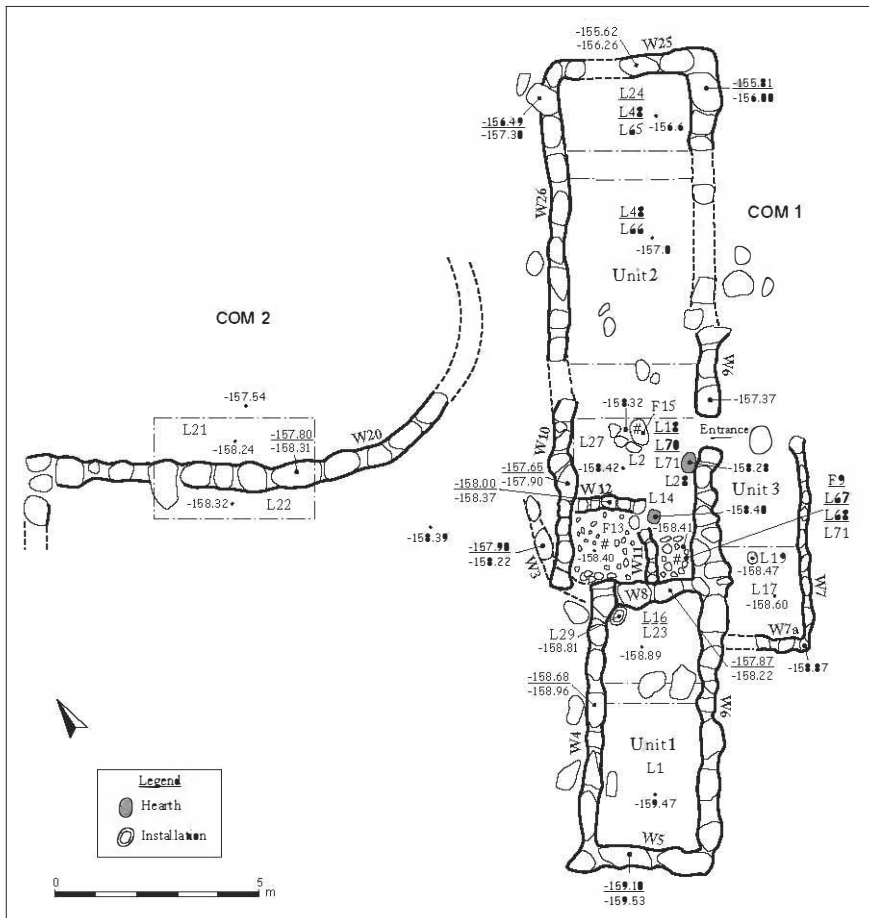

Fig. D3. Plan of the excavated area.

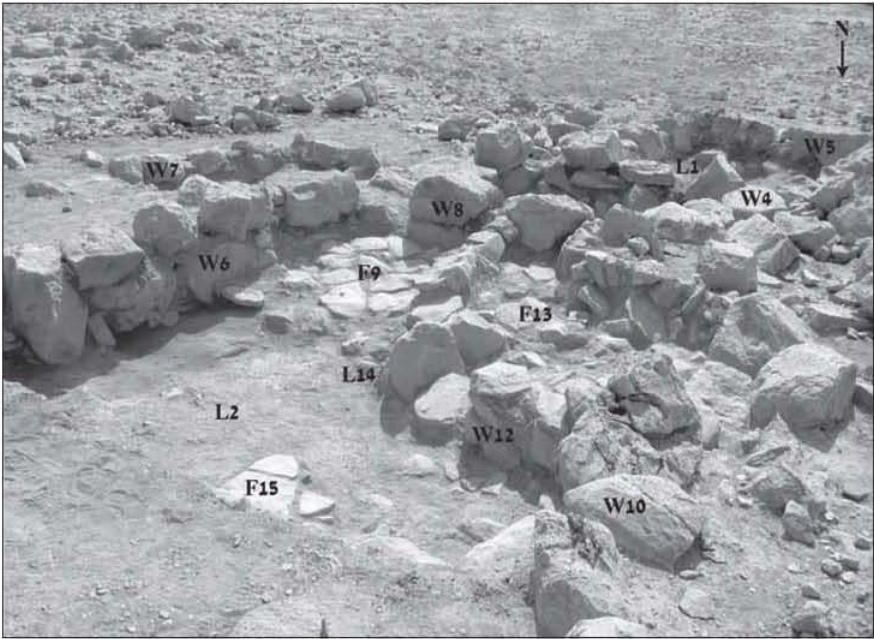

Fig. D4. Com 1, view to the south.

Fig. D5. South-eastern room of Com 1, view to the north-west. Note the large *in situ* lower grinding stone and size of the boulders of W5.

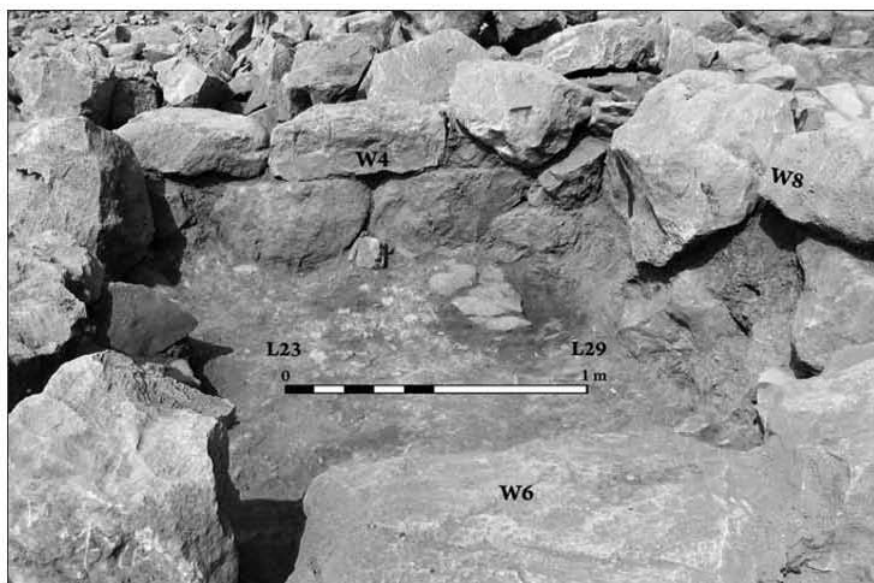

Fig. D6. L23 and baking installation L29, view to the north-west.

Fig. D7. Baking installation L29 in Unit 1.

phases in the usage of this building.

Between Units 1 and 2 a built wall (W8) bridges over a 50 cm height difference between the living surfaces of these two abutting units.

Unit 2 – the north-eastern room (Figs. D3-4; D8-9):

Unit 2 is 4.25×2.5 m in size, bounded by walls W6, W8, W10 and W25-26. The masonry is identical to Unit 1, and large monoliths are incorporated into the walls. Two stone courses are preserved, up to about 70 cm high on the average. Only two parts of this unit were excavated: the north-eastern part of the Unit (L24) where the dig ended before reaching habitation levels, and the south-eastern part of the unit in the centre of Com 1. While W6 continues in a north-easterly direction, W4 ends where it abuts W8. The construction here is not very clear, and the relations between W10, the external north-eastern wall of the building and W8, the boundary between Units 1 and 2, are not known. It is probable that W10 continues to the north-east (also including W26) until it abuts W25 at the north-eastern end of Com 1. Most of this area is still not excavated.

The inner walls of Unit 2 (W11, W12) are thinner than the outer walls. They are built of medium- and small-sized stones, 50 cm wide, and survived up to three courses. A small cell, 3.8 sq. m in area and paved with stone slabs, was created between these walls. To the west of W11 another similarly stone-paved surface was found (L9), and further to the north were the remains of another partly preserved stone-paved surface (F15 - Fig. D8). Between these paved surfaces was a beaten earth floor. On it two hearths were found (L14, L28 - Figs. D8-9). L14 was in a niche between walls W11 and W12 (Fig. D8), where large fragments of a holemouth cooking jar were found.

In W6, the north-eastern wall of Com 1, the remains of an entrance to Unit 2, were found. The entrance is marked by two standing monoliths up to 1 m high (Fig. D9). This entrance is located in the middle of the Com 1 building. No other entrances were found.

Unit 3 – An additional room adjacent to the main building (Figs. D3, D10):

Unit 3 is located adjacent and to the east of the main building excavated, and based on its location and the orientation of its walls, it is reasonable to suggest that it was part of Com 1.

Two walls were preserved (W7 on the east and W7a on the south), enclosing an area 2×5 m. They are built of a single row of medium-sized stones. A beaten earth surface (L17) was discovered. On it the scanty remains of a poorly preserved hearth (L19) were found (Fig. D10).

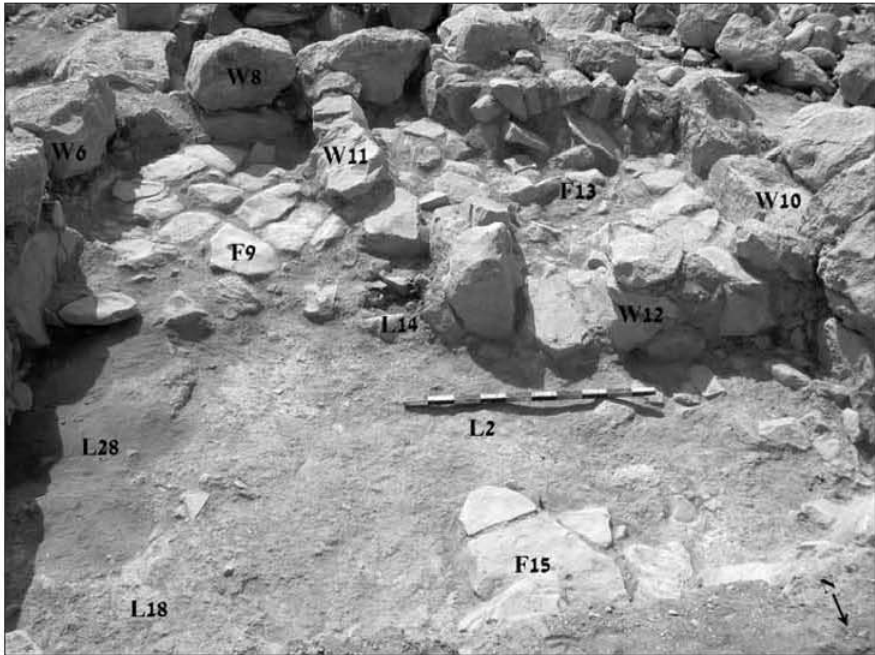

Fig. D8. The centre of Com1, view to the south. Note the stone pavements (F9, F13 and F15) and hearths (L14 and L28).

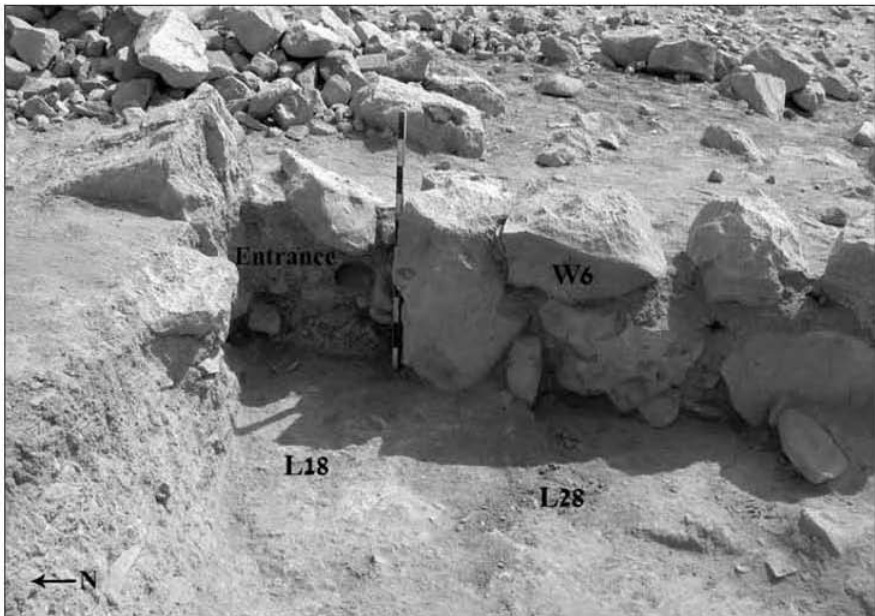

Fig. D9. The built entrance to Com1, view to the east.

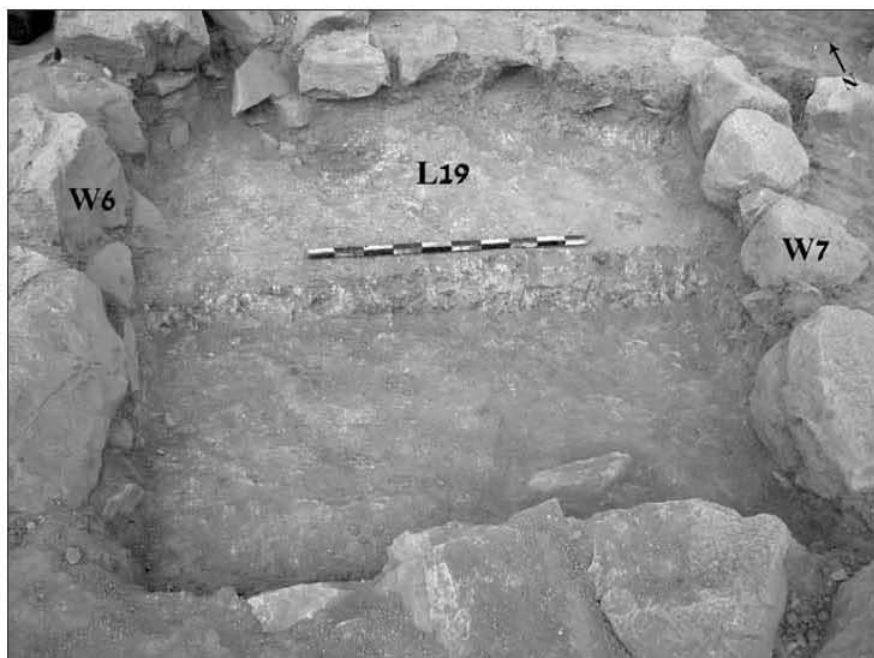

Fig. D10. Unit 3, view to the north.

Fig. Dn. The excavation in Com 2, the courtyard, view to the south-west.

Fig. D12. Fencing of modern Bedouin camps with *Tamarix* and *Ziziphus spina-christi* bushes in the Jordan Valley, 2008. Note that the foundation of this fence is made of scrap metal.

Com 2

Com 2 is the adjacent courtyard, 12 m in diameter, to the north-west of Com 1 (Figs. D3, D11). It was visible on the ground of the site prior to the excavation. Its eastern curving wall is only 2 m from W26 of Unit 2 of Com 1. The wall of the courtyard, W20, is built of large fieldstones in one row, similar to the masonry of some of the Com 1 walls. It seems that this curving wall was the foundation of a fence made of organic materials that did not survive. This type of masonry is still common today in Bedouin animal husbandry in their camp sites in the Jordan Valley (Fig. D12; Eitam 1996). In the small-sized excavation in the courtyard (L21) we were not able to discover the original living surface of the courtyard, and only non-indicative flint items were retrieved. In the outer side of the courtyard (L22) a similar picture emerged, and it revealed no important information, apart from non-indicative pottery.

The adjacent location and the similar masonry of Coms 1 and 2 support the suggestion that the courtyard was part of the IBA site.

The Pottery Assemblage

The scanty finds comprise 384 sherds, of which only 21 are indicative. Combining the spatial location of the finds and the 'minimum number of individuals' principle, the following picture emerges:

1. In Unit 1 the finds include an outwardly curved jar rim, a ledge handle, and a sherd bearing rope ornamentation. All these are possibly from the same jar, the only pottery item found in this room.
2. In Unit 2 the finds include 4 holemouth jar rims and 1 jar rim (Fig. D13: 1-3, 5). Two ledge handles and a lug handle probably belonged to some of these jars.
3. In Unit 3 the finds include a holemouth jar rim and a jar rim (Fig. D13: 4). A sherd bearing rope ornamentation (Fig. D13: 7) probably belonged to one of these.

The entire assemblage of Com 1 therefore consists of five holemouth jars and three jars. Of these, only two holemouth jar cooking vessels were found *in situ* near hearths that served as cooking installations. No typical IBA tableware items, such as caliciform goblets, bowls, or amphoriskoi, were found. Only five sherds (1.3% of the assemblage) had any kind of decoration (four had rope ornamentation – Fig. D13: 7, and one was an incised sherd). No use of colour or other surface treatment was noted, and all the pottery was hand-made.

The main types found are:

1. The commonest type at the site is the holemouth jar with an inverted rim (Fig. D13: 1-2). Soot traces testify to its use in cookery. It is barrel-shaped and varies in dimensions. This is a common IBA type, and parallels were found at Nahal Alexander (Dar1977: plate B: 19) and 'Ein Ziq (Cohen 1999: fig. 11: 9).
2. Another holemouth jar type has a thickened cut rim and a narrow body (Fig. D13: 3). This is not a common type, but a parallel was found at Har Yeruham (Cohen 1999: fig. 69: 26).
3. A jar with a long neck and a straight rim flaring slightly outwards (Fig. D13: 4).
4. A barrel-shaped jar with a shallow neck and a flaring rim was also found (Fig. D13: 5). Parallels were found at Hazorea (Meyerhof 1986: fig. 9: 8) and Khirbet Iskander, tomb D3 (Peterman and Richard 2010: fig. 10.13: 9).

Although very small, this pottery assemblage presents the following important issues:

1. It represents the first radiometrically dated early IBA (EB IVa) assemblage excavated in the western flank of the lower Jordan Valley.

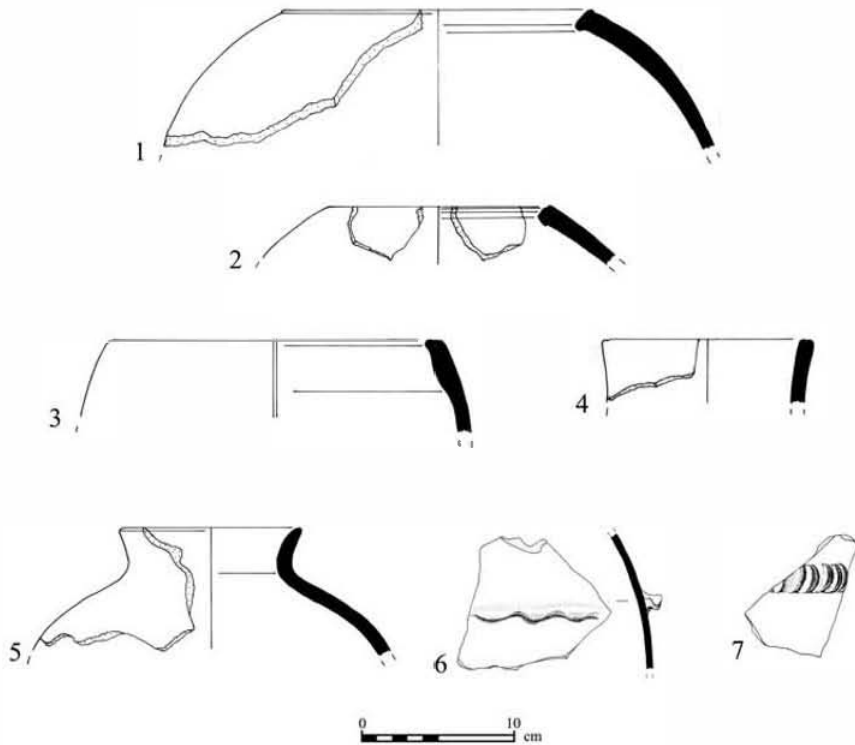

Fig. D13. Pottery from Com 1.

Number	Locus	Description
1	2	Pale brown clay, reddish core, white and grey grits (mainly calcite), remains of soot on the outer part of the vessel, poorly fired
2	18	Brown clay, reddish core, white and grey grits (mainly calcite), remains of soot on the outer part of the vessel
3	18	Brownish-grey clay, brown core, white and black grits, remains of soot on the outer part of the vessel, poorly fired
4	17	Brownish-grey clay, grey core, grey and black grits, good firing
5	2	Light coloured clay, reddish core, grey grits (mainly calcite), remains of soot on the outer part of the vessel, poorly fired
6	2	Pale brown clay, pale brown core, white and grey grits, remains of soot on the outer part of the vessel
7	17	Reddish clay, grey core, white and black grits, remains of soot on the outer part of the vessel

Table D1. Pottery from Com 1.

2. The composition of the assemblage suggests a site where cooking and storage activities took place. The absence of tableware is striking, and suggests that the site was not a typical dwelling village.
3. Many typical IBA types are missing altogether (e.g. goblets, caliciform ware, four-spouted lamps, combed decorations, etc.). If this is not merely the result of the limited exposure, or the unusual function of the site, then it might shed new light on the poorly researched early stages of this period.

The Flint Assemblage²

The flint assemblage from the site is small and consists of only 255 items (Table D2; for a detailed methodology see Bar 2008: chapter 7.5.5). Of Groups A (waste, including cores, primary elements, chunks and chips) and B (debitage, including flakes, blades and bladelets) all items were present (65.1% and 30.2% of the assemblage). Of Group C (tools) only 12 items (4.7% of the assemblage) were found. It seems that primary flint knapping took place at the site, but more advanced flint processing was done elsewhere, at least not in the excavated area. The small number of tools is notable. They are not indicative of a specific period, and most of them are ad-hoc items. The absence of sickle blades is of some significance.

The very small assemblage makes it difficult to draw conclusions. No typical IBA tool types are present. From the sparse finds it is reasonable to assume that this ad-hoc industry was mainly connected to food preparation processes. The scarcity of finds is typical of the later Bronze Age rural societies, where a sharp decline in lithic technology is evident after the end of the Prehistoric and Proto-historic periods.

² This section was written by H. Winter.

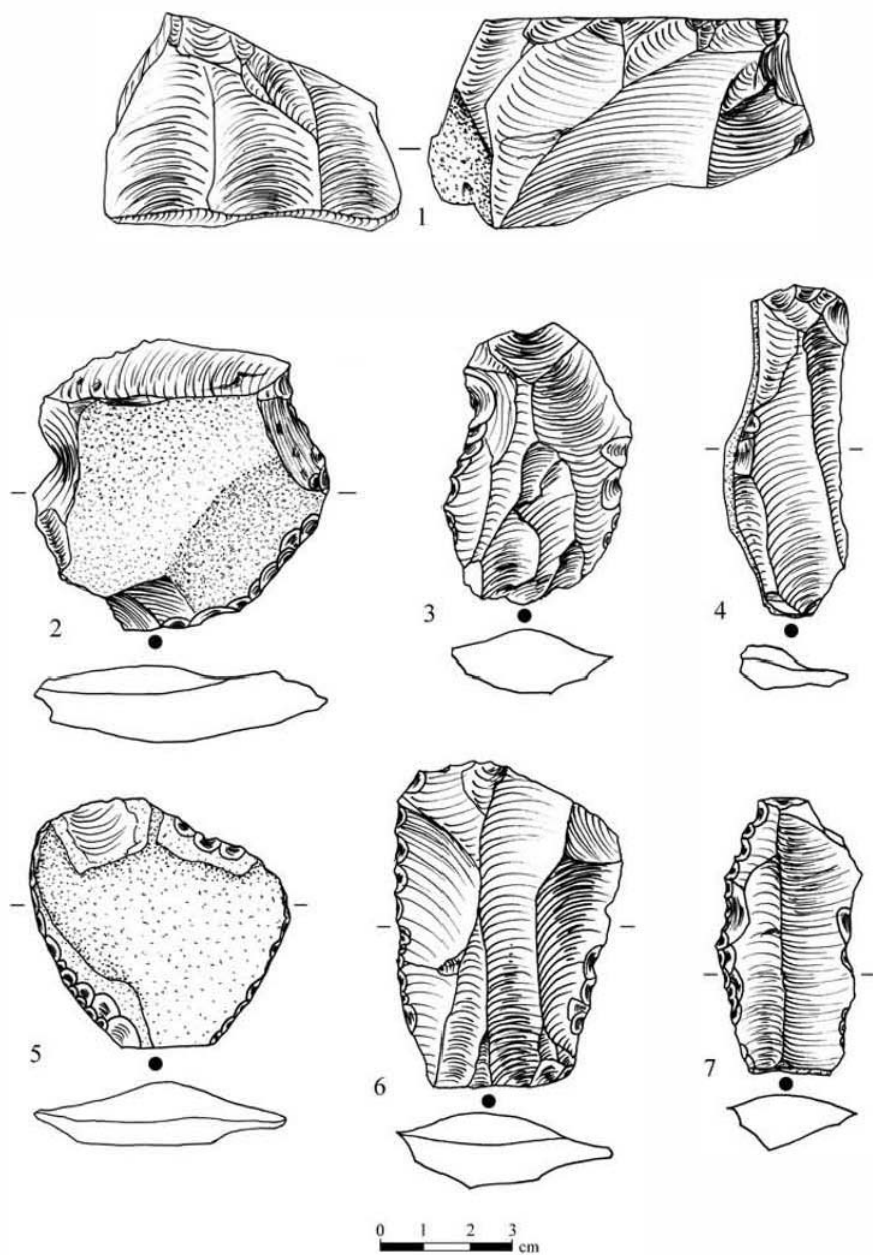

Fig. D14. Flint items from Com 1: 1. Core; 2. Notch; 3. Denticulate; 4. Backed knife; 5. Fan scraper; 6. Retouched flake; 7. Retouched blade.

Group	Items	n	%
A (waste)	Core	6	
	Primary element	43	
	Chunk	81	
	Chip	36	
Total A		166	65.1
B (debitage)	Flake	55	
	Blade	21	
	Bladelet	1	
Total B		77	30.2
C (tools)	Burin	1	
	Notch	2	
	Denticulate	1	
	Fan scraper	1	
	Retouched flake	3	
	Retouched blade	1	
	Backed knife	2	
	Truncation	1	
Total C		12	4.7
Total site		255	100

Table D2. Flint items from EP -167.

The Stone Tool Assemblage

Only three stone tool items were found during the excavation. These are:

1. A very large (32×48×21.5 cm) lower grinding stone made of hard limestone (Figs. D5, D15: 1). It was found *in situ* in Unit 1, and was used in the food preparation process. Its upper grinding stone was not found.
2. A large (22×22×10.5 cm) grinding bowl/basin made of limestone (Fig. D15: 2). It was found in Unit 2 (not *in situ*), and was probably used for grinding in the food preparation process. The walls of the bowl are 5 cm thick, and the base is partly broken and almost completely worn (2 cm thick), attesting to a long period of use.
3. A broken limestone grinding mano, measuring 8×12×3.5 cm was found in Unit 2 (not *in situ*).

All the stone tools retrieved attest to grinding of materials, probably as part of the food preparation process.

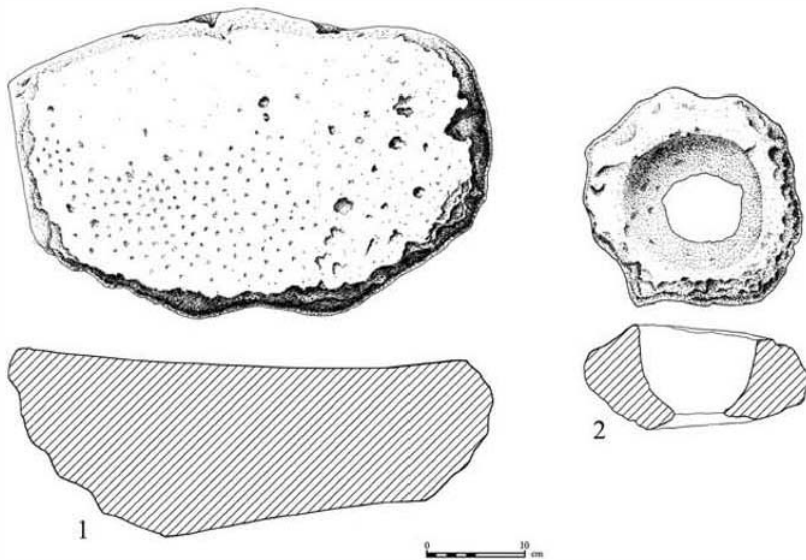

Fig. D15. Stone tools from Com 1.

Radiometric Dating³

Two charred wood samples were collected from two different loci in Unit 2, and submitted for radiocarbon dating (Table D3; Fig. D16). Sample 5667 was taken from fill L2 above stone-paved floor F15, and sample 5826 was taken from floor F18.

The results of the two samples are very similar, and suggest a date in the early stages of the IBA (or EB IVa).

Sample no.	Type	¹⁴ C age ± 1 sigma year BP	Calibrated age
5667	Charcoal	3850±40	68.2% probability: 2460 BC (19.1%) 2370 BC 2360 BC (33.8%) 2270 BC 2260 BC (15.3%) 2200 BC 95.4% probability: 2470 BC (95.4%) 2200 BC
5826	Charcoal	3900±45	68.2% probability: 2470 BC (68.2%) 2340 BC 95.4% probability: 2490 BC (90.4%) 2270 BC 2260 BC (5.0%) 2200 BC

Table D3. Radiocarbon dates from E.P. -167.

Dendroarchaeology⁴

Three samples from loci F13, F18, and L23 were identified as *Tamarix*. The location of the samples was from hearths, baking installations and floors, implying the possible use of *Tamarix* as the fuel in the food preparation process at the site.

Discussion and Summary

The site function of EP -167 remains unresolved after the first season of excavations. The unique architecture represents a plan of a type that has no parallels in the known sites from this period in the Jordan Valley. The long rectangular buildings and the adjacent courtyards (Fig. D2) on the banks of a

3 The dating was done by E. Boaretto from the Kimmel Center for Archaeological Science in the Weizmann Institute. The methodology and procedures are presented in Bar 2008: 482.

4 The identification of the plant and wood remains was made by N. Liphschitz of Tel Aviv University. The methodology of the work can be obtained from the researcher.

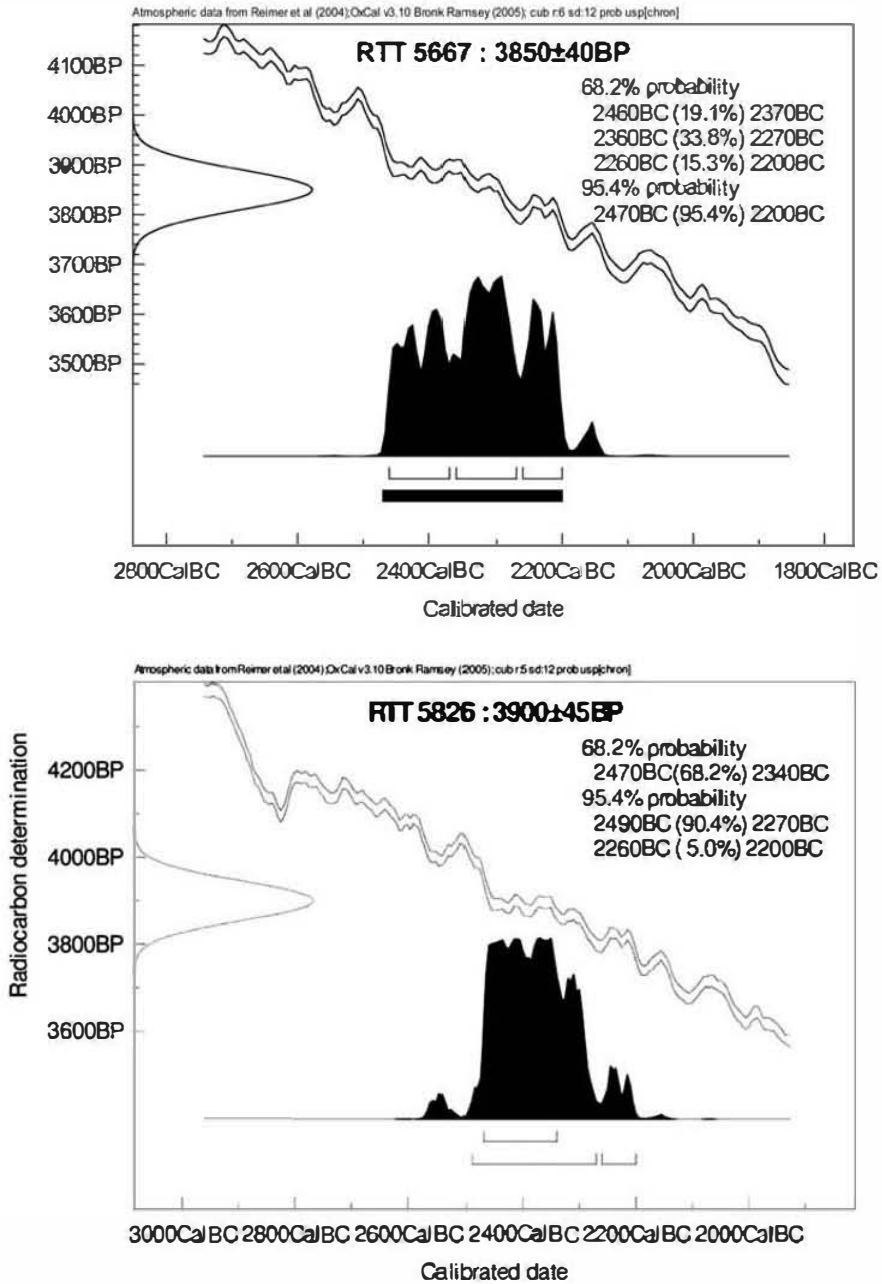

Fig. D16. Radiocarbon date graphs from E.P. -167.

perennial stream suggest a village housing a small community based on animal husbandry (represented by the animal pens), with some agriculture (because of the location near the perennial stream and nearby flat land that are ideal for agricultural fields). However, the finds from the dig suggest otherwise, and the sparse finds of all aspects of material culture are significant. The small quantity of finds suggests that the site was abandoned in an orderly manner and/or that it was uninhabited for a long period (either seasonally or annually for a short period). This is further supported by the fact that the architecture and stratigraphy reveal that there were few changes in the building plans. No tableware was found in the ceramic assemblage, and only cooking and storage vessels were retrieved. The lithic tool kit mainly comprised items associated with the food preparation process, and the absence of sickle blades indicates that agricultural field work was not an important component in the economy. The ground stone assemblage also indicates a food preparation process at the site. The absence of animal bones is striking. If this is not the result of the state of preservation of the site, or post-depositional processes, then it also supports the idea that this was not a typical dwelling site.

At this stage of research the main activities represented at the site are food preparation processes, with lesser evidence of herd management. Only expansion of the excavation will allow for better understanding of the cultural and economic nature of the site.

The site is dated to the early IBA (EB IVa). Our knowledge of this period of the western flank of the Jordan Valley is still scanty. A research project of this period was recently commenced by the author (Bar et al. 2012; 2013; Bar 2015a; 2015b). We hope that this research will be fruitful in presenting a better understanding of the site at EP -167, alongside a more profound and detailed database for the deeper understanding of the IBA in the Jordan Valley.

APPENDIX E

THE COIN FINDS

Haim Shkolnik and Shay Bar

The catalogued description of 24 surface coin finds presented here covers a period of 1000 years, from the Roman period to the Middle Ages (from the 4th to the 14th centuries CE). This list presents the origins and dates of minting of the coins. Most of the coins were minted throughout the empires that controlled the land in these periods.

The coins are listed according to site numbers, in chronological order within each site.¹

Site No. 8:

¹ The coins were cleaned by R. Shafir and A. Iermolin of the Zinman Institute of Archaeology, University of Haifa.

Khellalyel Madkhul (2)

1. Byzantine. Justin II (15 November 565–5 October 578), Nicomedia, 570/571 CE.

Obverse: DN IVST[INVS PP AVC]. Justin (on left) and Sophia sitting facing on double throne, both wear headgear and nimbate. He holds a *globus cruciger*, she holds a cruciform sceptre resting on her right shoulder. Cross between heads.

Reverse: large M, ANNO to left, ¶ (regnal year 6) to right. Cross above, B (2nd officina) below. Mint mark NIKO in exergue.

Æ follis, ⚡, 11.75 gm, 29 mm.

Site No. 18:

Tell el-Ridhghah

4. Byzantine. Maurice Tiberius (13 August 582–22 November 602), Constantinople (?), 588/589 CE.

Obverse: [...]ER PP, helmeted and cuirassed bust facing, holding a *globus cruciger* in right hand, shield with horseman device in left.

Reverse: large K, ANNO to left, regnal year **CI** (7) to right, cross above, 1st (4th) *officina* mark A (Δ) below (worn).

Æ half *folles*, ↓, 4.67 gm, 24 mm.

References: Bellinger 1966: 313, no. 53e.1; Warwick 1966: 135, no. 83; Tolstoi 1967: 549, nos. 239–240; Bates 1971: 70, no. 581.

5. Medieval, Zandjīd Atabegs of Halab. Nur ad-Din Mahmud (1146–1174 CE), Dimashk, 1162–1169 CE.

Obverse: dotted circle with الملك العادل in centre, stars and floral scrolls above and below. Obscure counter-clockwise marginal legend with mint name.

Reverse: as above, with محمود بن زنكي in centre. Obscure counter-clockwise marginal legend with year.

Æ *folles*, ↘, 5.64 gm, 26 mm.

References: Berman 1976: 63, no. 163; Mitchiner 1977: 190, no. 1134; Album 2011: no. 1851.

Site No. 21:

Wadi Salman (2)

6. Arab-Byzantine. Anonymous, third quarter of 7th century CE³.

Obverse: emperor standing, wearing crown and long robes, holding a *globus cruciger* in left hand and long cross in right. Possibly traces of blundered Arabic legend to left.

Reverse: large cursive M, cross above. ANA to left, [...]N to right. Possibly traces of Arabic legend in exergue.

Æ *folles*, clipped flan, →, 2.11 gm, 24 mm.

Reference: Goodwin 2005: 34, no. 6; Cf. coin No. 15 here.

2 We lack satisfactory grounds for distinguishing between coins of this type struck in Constantinople, Nicomedia and Cyzicus (those without mint mark in exergue), as Sear points out (2006: 120), and as Tolstoi doubted earlier (Tolstoi 1967: 547). Wroth suggested (in Warwick 1966) ascribing all half *folles* with no mint marks to the mint of Constantinople – because of their appearance and *officina* marks. During Maurice's reign *Officinae* Γ, Δ, and Ε apparently operated only in Constantinople. Cf. also Bellinger 1966: 311.

3 Weight and general appearance lead us to conclude that this coin belongs to a pseudo-Byzantine issue, and not to Constantine II's actual coinage, which it imitates.

References: Bellinger 1966: 16, no. 20e.2; Warwick 1966: 6, no. 40; Tolstoi 1967: 185, no. 29.

18. Byzantine. Justinian I (1 August 527–14 November 565 CE), Constantinople, 527–538 CE.

Obverse: DN IVSTINIANVS PP AVC, diademed and cuirassed bust with *paludamentum* fastened with a brooch ornamented with star, to right⁶.

Reverse: large M, cross above, below B (2nd *officina*). Star to left, cross to right. Mint mark CON in exergue.

Æ follis, ↓, 14.27 gm, 31 mm.

References: Bellinger 1966: 79, nos. 28b.1–5 (the star is different - *); Warwick 1966: 29, no. 29; Tolstoi 1967: 309, no. 84.

Site No. 48:

En-Na'ajeh (2)

19. Roman Imperial, House of Constantine. Constantine I the Great (27 February 306–22 May 337 CE) as *Augustus*, Rome, 330 CE.

Obverse: CONSTANTINVS MAX AVG, rosette-diademed, draped and cuirassed bust to right.

Reverse: GLORIA EXERCITVS, two soldiers standing facing one another, holding spears, resting hand on shield set on ground, with two standards between them. In exergue 1st *officina* mint mark RFP.

Æ 3 (reduced *centenionalis*), ↑, 2.53 gm, 19 mm.

Reference: Bruun 1966: 336, no. 327.

Site No. 49:

En-Na'ajeh (3)

20. Roman Imperial, House of Constantine. Constans (337–350 CE) as *Augustus*, Antioch, 347–348 CE.

Obverse: [DN CONST]NS PF AVG, pearl-diademed head to right.

6 Bellinger (1966: 78) believes the brooch to be represented by a plain circle, while the star is meant to decorate the Emperor's tunic.

Fig. E17: Byzantine coin of Anastasius I from Habs Qatwi (2).

Fig. E18: Byzantine coin of Justinian I from Habs Qatwi (2).

Fig. E19: Roman Imperial coin of Constantine I from en-Na'a'jeh (2).

Fig. E20: Roman Imperial coin of Constans from en-Na'a'jeh (3).

Reverse: VOT XV MVLX enclosed in wreath terminating in rosette, mint mark SMANI (10th *officina*) below.

Æ 4 (reduced *centenionalis*), ⚭, 1.75 gm, 15 mm.

Reference: Kent 1981: 521, no. 116.

Site No. 54:

Wadi Umm Khubeza (3)

21. Byzantine. Justinian I (1 August 527–14 November 565 CE), unknown mint⁷, 527–538 CE.

Obverse: DN IVSTINIA[NVS PP AVC], diademed and cuirassed bust with *paludamentum*.

Reverse: large M, cross above, below B (2nd *officina*). Star to left, cross to right. Mint mark entirely worn.

Æ *follis*, ⚭, 17.24 gm, 31 mm.

References: Bellinger 1966: 79, nos. 28b.1–5 (the star is different – *), 110, no. 110.1; Warwick 1966: 29, no. 29; Tolstoi 1967: 309, no. 84. Cf. coin No. 18 here.

Site No. 59:

Wadi Umm Kharubeh (1)

22. Roman Imperial, House of Constantine. Constantine I the Great (27 February 306–22 May 337 CE) as *Augustus*, Nicomedia, 328/329 CE.

Obverse: CONSTANTINVS A[VG], pearl-diademed head to right.

Reverse: PROVIDEN[TIAE] AVGG, camp gate with two turrets, star above. Mint mark SMNA (1st *officina*) below.

Æ 3 (reduced *centenionalis*), ⚭, 2.44 gm, 18 mm.

Reference: Bruun 1966: 625, no. 153.

Site No. 63:

Es-Sahl (2)

23. Late Roman Imperial. Valentinian I (26 February 364–17 November 375), Alexandria, 364–367 CE.

Obverse: DN VALENT[INIANVS PF AVG], pearl-diademed, draped and cuirassed bust to right.

Reverse: [SECVRITAS REIP]VBICA[E], Victory advancing to left, holding palm in left and wreath in right, mint mark ALEA (1st *officina*) below.

⁷ The coin was probably struck at Constantinople or, most likely, Nicomedia – because of style and combination of star, crosses, *officina* mark and weight.

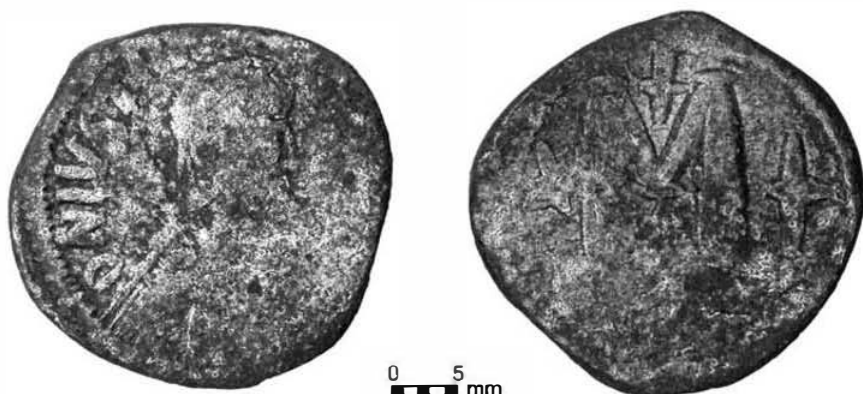

Fig. E21: Byzantine coin of Justinian I from Wadi Umm Khubeza (3).

Fig. E22: Roman Imperial coin of Constantine I from Wadi Umm Kharubeh (1).

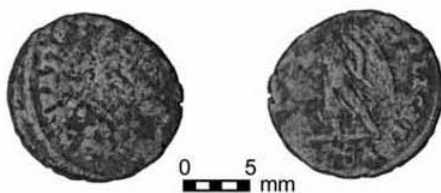

Fig. E23: Late Roman Imperial coin of Valentinian I from es-Sahl (2).

Fig. E24: Byzantine coin of Justin II from Bedhat esh-Sha'ab.

Æ 4, ↑, 2.12 gm, 14 mm.

Reference: Pearce 1968: 298–299, nos. 3a, 5a.

Site No. 65:

Bedhat esh-Sha'ab

24. Byzantine. Justin II (15 November 565–5 October 578), Constantinople, 575/576 CE.

Obverse: DN IVSTI[NVS PP AVC]. Justin (on left) and Sophia sitting facing on double throne, both wear headgear and nimbate. He holds a *globus cruciger*, she holds a cruciform sceptre resting on her right shoulder. Cross between heads.

Reverse: large M, ANNO to left, XI (regnal year 11) to right. Cross above, B (2nd officina) below. Mintmark CON in exergue.

Æ follis, ↗, 14.64 gm, 31 mm.

References: Bellinger 1966: 212, nos. 4ob.1–5; Warwick 1966: 82, no. 78; Tolstoi 1967: 438, no. 106.

LIST OF SITES BY PERIOD

Prehistory:

2, 19, 39, 47, 57, 86, 104, 115, 123, 126, 128(1), 137-138, 143, 149, 151, 153, 164, 169-170, 172-173, 175-175(2), 175(5), 183(1), 185, 195, 197-198, 202-204.

Neolithic:

13, 60, 72, 94(?), 175, 175(2), 183(1).

Chalcolithic:

3-5, 11-13, 18-19, 23(1), 24, 27-28, 31-33, 36, 42, 59-60, 77-80, 89, 91(?), 94, 96, 128, 150, 164(?), 180(?), 183(?), 184(?), 188, 193, 195, 198, 201.

Early Bronze Age I:

2-4, 11, 13, 18, 26, 28, 32-33, 60, 72-75, 77-80, 82, 93, 96, 150, 180(?), 201-202.

Early Bronze Age II-III:

3-4, 11, 13, 26, 28, 32-33, 60, 72-75, 79, 82, 84, 93, 202.

Intermediate Bronze Age:

1, 3-5, 7, 9, 14, 20, 41, 71, 77, 80-81, 192, 195.

Middle Bronze Age II:

3-5, 11, 13, 16, 18, 23, 26, 28, 30, 32-33, 60, 73, 84, 99, 104(?), 130, 159-160, 161, 166, 198.

Late Bronze Age:

3, 10-11, 13, 23, 30, 32-33, 44, 47, 51, 59, 130(?).

Iron Age I:

3-4, 9-11, 13, 16, 18-19, 21, 23, 30, 32-33, 35-36, 43-45, 48, 56, 60, 62-65, 68-69, 71-72, 76, 78-79, 83-84, 86, 88, 92-93, 95-99, 104-105, 107, 108(?)-109, 126, 130, 134, 140-141, 144, 150, 154, 159, 166, 173, 178, 182(1), 187, 189, 194, 196-197, 199(?)-200.

Iron Age II-III:

3-4, 11, 13, 16, 18-19, 21, 23, 30, 32-33, 36-38, 43-47, 49-51, 53-57, 59-60, 63-69, 71-74, 78, 82-84, 86-87, 96-100, 102-102(1), 104-105, 109, 112-116, 117-118, 121-122, 124-126,

128, 129-134, 137-138, 140-141, 143-145, 147-152, 154-159, 162-163, 167-169, 173, 174, 175(2)-175(3), 176, 178, 182(1)-183, 186, 187, 189, 191, 194, 196-197, 200.

Persian period:

3-4, 8-9, 11-13, 16, 18-19, 28, 30, 32-34, 49, 82, 84, 102(1), 166.

Hellenistic period:

3, 8-9, 11, 16, 18-19, 23, 28, 32-34, 36, 60, 66, 99, 129, 133, 138, 140, 145(?), 152, 158, 163-164, 166, 171-173(1), 186(1), 194, 196, 199.

Early Roman period:

5, 9, 11-13, 18-19, 30, 33-34, 36, 38(1), 44-45, 59-60, 66, 82, 85-86, 90(1), 100, 103, 129, 131, 134, 145, 156, 164, 166, 168-169, 171-173(1), 174(1)-174(2), 175(1)-175(4), 176, 186, 199.

Late Roman period:

6-7, 11-12, 17-19, 22, 24-26, 28, 30, 32-34, 36-38(1), 40, 44-45, 48-49, 51-53, 55, 57-60, 63-65, 69, 74, 80, 82-83, 85-88(1), 90(1)-91, 93, 95, 97-99, 102, 103-105, 107-109, 111-119, 121-122, 124-128, 129-152, 154-155, 157-159, 162-164, 166, 168-169, 172, 173, 174-174(2), 175(1)-175(4), 176-180, 182(1)-183, 184, 187-188, 190(?)-191, 194-198, 202.

Byzantine period:

2, 6, 8, 11-13, 15, 18-19, 21-22, 23(2), 25-30, 32-38(1), 40, 43-47, 50-51, 53-55, 59-61, 65-68, 70, 72, 74, 76, 78, 80, 82, 84-86, 88(1)-90, 95-96, 98, 101, 103, 113, 115-116, 120, 124, 127-128, 129, 131-134, 136, 140-141, 145, 149-151, 154-155, 160, 162-164, 167-168, 173, 174-174(2), 175(1)-175(4), 176, 179, 182-183, 185, 191, 195-196.

Early Moslem period:

6, 8, 11-13, 18-19, 22, 23(2), 25, 26, 28, 30, 32-33, 53-55, 58, 61, 65-66, 80, 84-87, 90-90(1), 120, 124, 149, 152, 164, 176, 182.

Middle Ages:

6, 11, 16, 18, 22, 23(2), 25-28, 32-34, 37, 45, 47, 50-53, 55, 60-61, 63-64, 66-67, 69, 72, 74, 80, 82-85, 90, 93, 99, 105, 111-112, 115-116(1), 120, 122, 125, 129, 132, 137, 140, 142, 145, 147, 150-152, 154, 159, 162, 164, 166, 167-168, 172-173, 174-174(1), 175(1)-175(3), 176, 178-179, 182-183, 185, 187, 191, 194, 195(?)-196, 202.

Ottoman period:

6, 8, 11, 22, 28, 67-68, 82, 95, 121, 127, 132-133, 138, 140, 149, 162, 164, 175(1)-175(2), 179, 180, 182, 187, 202.
