

represent an earlier phase. In other words, W62250 may be later than the first construction phase of the building, and post-date the destruction in room L62270.

All assemblages retrieved from Area B1 date to the 14th century BCE (Fig. F21). An important insight from the preliminary analysis is the quantity of Egyptianized bowls and jars, attesting to Egyptian influence on pottery production (e.g. fig. F21: 1).

An Iron Age I pit in Square R/42:

Area B1 had already been probed by a deep narrow section (Zertal 2003; and see aerial view in Fig. F14). During the renewed excavation this area was cleaned and a pit was discovered. Although the upper part of the pit no longer existed, sufficient pottery has been collected to date the pit to the Iron Age I. As the only place on the tell where Iron Age I pottery was retrieved, it attests to some presence from this period. In addition, the small ceramic assemblage included some uncommon vessel types (e.g. a large flask and a multi-pierced handle – Fig. F20).

Fig. F22: The western facade of the Middle Bronze Age IIa tower (left) and the collapse over the city wall (right) in Area B2, looking south-east.

AREA B2

Area B2 is situated on the northern slope between Areas B and B1. A 5 m square section, stretching from the top of the tell to the level ground below, was opened here (Fig. F14). In the upper Squares UT/40-42 the remains of a few Late Bronze Age walls were exposed near a round installation, and also a living surface with a cache of geometric sickle segments *in situ*.

In the middle of the section, in Squares UT/42 and 43, a massive stone collapse probably indicates the location of the Middle Bronze Age IIA city wall. In Squares U/43 and 44 below, the western remains of an impressive Middle Bronze Age tower more than 2 m high (mainly excavated in Area B to the east) were exposed (Fig. F22). Between the tower and the city wall was a gap of 50 cm, the reason for which is not yet clear.

In the lower squares the pottery assemblage comprised mainly Chalcolithic and Early Bronze Age I shards. The fact that they were found in the fills, and not *in situ*, indicates earthworks conducted when erecting the Middle Bronze Age fortifications. Soil from Chalcolithic–Early Bronze Age contexts was utilised during these earthworks, bringing a wealth of finds into the lower part of the B2 section.

AREA D

Area D is situated in the western side of the small tell east of Tel Esur. Among the three strata exposed, the main feature is the Stratum D2 (Iron Age IIB) administrative building, which was exposed close to the surface (Figs. F23 and F24).

Stratum D1

Remains of a wall (W54043) cutting the Stratum D2 building. It postdates the Iron Age IIB Stratum D2, but no datable material was associated with it, and at this stage it has not been dated.

Stratum D2

Below the surface the impressive remains of a large building, at least 200 sq. m in area, were unearthed. Its outer southern, western, and northern walls (walls W44026, W54006, W54021) have been revealed, and it seems to continue to the east. Although the western part was damaged, the direc-

tion of the walls can still be traced. The building has stone foundations with sun-dried bricks on top. A few bricks were revealed *in situ*, while most of them were found in the debris. The well-built walls are 120 cm wide (outer walls) and 80 cm (inner partitions).

In plan, the building had at least three rows of square rooms, three rooms in each row (Fig. F25). The slightly larger central room seems too small for an inner courtyard. The ceramic assemblage is dated to the middle of the 8th century BCE (Fig. F26).

Stratum 3

Below the floors of the Stratum D2 building, a wealth of pottery and flint items dating from the Neolithic to the Early Bronze Age I was retrieved,

the remains of the large proto-historic site excavated by Yannai (2006). The two curved walls (Fig. F27), excavated in Squares DF/13 and DE/12, probably date to the Early Bronze Age I.

Tel Esur - Summary and Conclusions

The 2.5 ha site of Tel Esur was founded in the Middle Bronze Age IIa, and continued to flourish in the next stage – IIb, being the only large known site in the northern Sharon. Although the place is rich in water, the areas of arable land around are limited. This is due to the *kurkar* ridge and poor *hamra* soils that cover large areas west of the site, and the drainage problems of Wadi 'Arah. It seems, therefore, that the reasons for the foundation and decline of the tell should be sought in the economic or political circumstances of the period. The strategic location near the entrance to the 'Arah pass played a role in its history, being a branch of *Via Maris* – an important trade route between the coastal plain and the Jezreel Valley. Its connection to thriving Middle Bronze Age Megiddo on the eastern entrance should also be examined. Can the history of the place be explained by its location between the powerful cities of Megiddo and Aphek? Based on the present

data, it is too early to suggest this, but the possibility cannot be ruled out.

After an interval, the site was re-inhabited during the Late Bronze Age IIa, in the 14th century BCE, mainly in the north of the tell. The pottery assemblage attests to Egyptian influence, perhaps connecting the pass and Megiddo. The earlier identifications with Djefit of Thutmose III (Aharoni 1958, and see Chapter 2) need re-appraisal because of the absence of a 15th century BCE stratum.

After the Late Bronze Age the settlement declined irreversibly. The Iron Age pits in Areas A and B1 are too scanty to represent a true occupation. An intriguing question in this regard is why the site declined at the end of the Late Bronze Age IIa, not to be resettled in the Iron Age. This remains unsolved at this stage, as are the reasons for its foundation and prosperity during the Middle Bronze Age. It seems that unknown political and economic causes were responsible for the abandonment of the site in the Iron Ages I–IIa. The sparse remains of Hellenistic and Roman period dwellings in the southern tell may represent farmers who took advantage of the nearby springs.

The administrative 8th century BCE building in Area D may point to activities during the Iron Age. The construction of the administrative building in the Iron IIB period, and its resemblance to similar buildings in Iron Age Israel (e.g. the corner buildings of Tel Jezreel), seem to be an initiative unconnected to previous settlement activity in the tell, but rather to external decision-making at a higher level, probably by the Kingdom of Israel.

The excavation at Tel Esur so far has contributed new data regarding the northern Sharon from the Middle Bronze Age to the Iron Age IIB. Further excavation and a careful study of the finds already obtained will enable us to clarify more answers regarding settlement in the tell and the coastal plain.

INDEX 1

LIST OF SPRINGS AND OTHER WATER SOURCES

Water sources are listed in this index. As already explained, each site is looked upon as a whole with its arable land, and the nearby water source. The springs and other water sources were numbered in running order from the beginning of the survey, and are arranged in this order from Volume One onward. The numbers appearing below are not consecutive, as only the sources mentioned in this Volume are listed.

Locations in all tables are given as East/North coordinates according to the Old Israel Grid (Israeli Cassini-Soldner Grid – ICS).

AGRICULTURAL INSTALLATIONS AND OTHER FEATURES

INTRODUCTION

As in the previous volumes, a list of installations and other features is included. It has been suggested that settlement sites should be recorded separately from other features (Zertal 2004). The linkage of a site to its agricultural vicinity is clear, but it is difficult to relate an installation or agricultural area to a particular site with certainty. The difficulty is because of the large number of sites, the conservatism in using the facilities, and the fact that a particular facility could have been in use for centuries, and sometimes for millennia. Hence, relating features and facilities to a site, or dating them to a period, requires separate thorough research. Such researches have been conducted by Dar (1982), Frankel (1984), Eitam (1993), and others.

Eitam has published his investigation of the installations in Khallet el-Gazaz, and Zertal has written about a unique phenomenon in the region – the quarried vineyard (Appendix D). In our work the first stage has been included – the gathering of data in the field. Nevertheless, it is appropriate to put forward in advance a few remarks for each type of feature and installation.

FIELD TOWERS

A structure built with large stones and thick walls, an opening, and a stone roof. Dar (1982; 1986), who investigated them, thought that they were used for storage of agricultural produce, a conclusion we have accepted. Of the many towers in the survey area, some have been published, with drawings, sketches, photographs, and numerous cross-sections (Dar 1986: 57–83). We have recorded some of the towers already registered, while continuing marking the towers in the regions further south, namely in the Narbatah and Bal'a districts.

Dar distinguishes between rectangular and round unsymmetrical towers. The latter have corbelled domes, similar to the structures found in el-Aḥwat. The structures excavated at el-Aḥwat were dated to the Iron Age I. The initial construction phase of the towers has been dated by Dar

to the Hellenistic period, and we suggest that they continued to be built and used in the Roman and Byzantine periods. The dating of the towers in el-Aḥwat to the Iron Age I period suggests two possibilities:

1. The dating of the towers by the el-Aḥwat expedition was not correct, and they were actually built later, in Stratum 1, when the site was in agricultural use in the Roman period. This argument is not well-founded, because the structure next to tower 42 is a stratigraphic part of the tower and wall construction, and Iron Age I sherds were found in the structure outside the wall;
2. Building and use of towers was introduced to the region in the Iron Age I period, and became an agricultural tradition in later periods. In addition, the round towers are common, especially in the areas surrounding el-Aḥwat, disappearing gradually to the south (in the north, in the Rammot Manasseh plateau, there are no towers at all).

Most of the towers are concentrated in the Umm-Riḥan (as recorded by the Umm-Riḥan expedition) and el-Munṭar areas. Their distribution is uneven, and further research is required.

WINE-AND OIL-PRESSES

This type of installation is abundant in the surveyed areas, and the relation between them and the towers should be studied.

A very large concentration of winepresses is present in a strip along the Jenin–Megiddo road (A2), and we tend to connect it with the distribution of the *dach'dich* (shafts quarried for planting a vineyard – see Appendix D).

STONE-CLEARANCE MOUNDS, TERRACES, AND STONE HEAPS

All these features are very widespread in the surveyed areas, and we have been trying hard to record them whenever possible. There is, however, great difficulty in linking them to a particular site.

The two tables below include the original list as published in the Hebrew version of the book, with additions based on unpublished material from the survey and subsequent fieldwork in this area.
